List of Tables

1	ascii	2
2	print.ascii	3

ascii is a R package for writing asciidoc or txt2tags document with embedded R commands.

1 short example

```
<<>>=  
x <- matrix(1:4, 2, 2)  
x  
@
```

gives :

```
> x <- matrix(1:4, 2, 2)  
> x  
      [,1] [,2]  
[1,]     1     3  
[2,]     2     4
```

```
<<results=ascii,echo=FALSE>>=  
ascii(x, caption = "A simple matrix", width = 30)  
@
```

gives :

A simple matrix | 1.00 | 3.00 || 2.00 | 4.00 |

2 what ascii provides

ascii provided :

- a generic method for common R objects: `ascii()`. Default argument depends of R object.
- two Sweave drivers: `Sweave("yourfile.Rnw", RweaveAsciidoc())` or `Sweave("yourfile.Rnw", RweaveT2t())`.

3 ascii manual

4 ascii examples

ascii provides methods for:

```
> methods(ascii)  
[1] ascii.anova          ascii.aov  
[3] ascii.aovlist        ascii.cast_df  
[5] ascii.character      ascii.coxph  
[7] ascii.data.frame     ascii.default  
[9] ascii.density        ascii.describe  
[11] ascii.describe.single ascii.factor  
[13] ascii.glm            ascii.htest  
[15] ascii.integer        ascii.list  
[17] ascii.lm             ascii.matrix  
[19] ascii.numeric        ascii.prcomp  
[21] ascii.smooth.spline  ascii.summary.aov  
[23] ascii.summary.aovlist ascii.summary.formula.response
```

<code>x</code>	An R object of class found among <code>methods(ascii)</code> .
<code>include.rownames</code>	logical. If <code>TRUE</code> the rows names are printed. Default value depends of class of <code>x</code> .
<code>include.colnames</code>	logical. If <code>TRUE</code> the columns names are printed. Default value depends of class of <code>x</code> .
<code>format</code>	Character vector of length equal to the number of columns of the resulting table (otherwise it will be replicated or truncated as necessary) indicating the format for the corresponding columns. These values are passed to the <code>formatC</code> function. Use <code>"d"</code> (for integers), <code>"f"</code> , <code>"e"</code> , <code>"E"</code> , <code>"g"</code> , <code>"G"</code> , <code>"fg"</code> (for reals), or <code>"s"</code> (for strings). <code>"f"</code> gives numbers in the usual <code>xxx.xxx</code> format; <code>"e"</code> and <code>"E"</code> give <code>n.ddde+nn</code> or <code>n.dddE+nn</code> (scientific format); <code>"g"</code> and <code>"G"</code> put <code>x[i]</code> into scientific format only if it saves space to do so. <code>"fg"</code> uses fixed format as <code>"f"</code> , but <code>digits</code> as number of <i>significant</i> digits. Note that this can lead to quite long result strings. Default depends on the class of <code>x</code> .
<code>digits</code>	Numeric vector of length equal to the number of columns of the resulting table (otherwise it will be replicated or truncated as necessary) indicating the number of digits to display in the corresponding columns. Default is 2. <code>decimal.mark</code> : The character to be used to indicate the numeric decimal point. Default is <code>"."</code> .
<code>na.print</code>	The character string specifying how NA should be formatted specially. Default is <code>""</code> .
<code>caption</code>	Character vector of length 1 containing the table+s caption or title. Set to <code>""</code> to suppress the caption. Default value is <code>""</code> .
<code>width</code>	Numeric vector of length one containing the table width relative to the available width (expressed as a percentage value, 1... 99). Default is 0 (all available width).
<code>frame</code>	Character vector of length one. Defines the table border, and can take the following values: <code>"topbot"</code> (top and bottom), <code>"all"</code> (all sides), <code>"none"</code> and <code>"sides"</code> (left and right). The default value is <code>""</code> .
<code>grid</code>	Character vector of length one. Defines which ruler lines are drawn between table rows and columns, and can take the following values: <code>"all"</code> , <code>"rows"</code> , <code>"cols"</code> and <code>"none"</code> . Default is <code>""</code> .
<code>valign</code>	Character vector of length one indicating vertical alignment of all cells in table. Can take the following values: <code>"top"</code> , <code>"bottom"</code> and <code>"middle"</code> . Default is <code>""</code> .
<code>header</code>	logical. If <code>TRUE</code> the first line of the table is emphasized. The default value depends of class of <code>x</code> .
<code>footer</code>	logical. If <code>TRUE</code> the last line of the table is emphasized. The default value depends of class of <code>x</code> .
<code>align</code>	Character vector of length one indicating the alignment of the corresponding columns. Can be composed with <code>"r"</code> (right), <code>"l"</code> (left) and <code>"c"</code> (center). Default value is <code>""</code> .
<code>col.width</code>	Numeric vector of length equal to the number of columns of the resulting table (otherwise it will be replicated or truncated as necessary) indicating width of the corresponding columns (integer proportional values). Default is 1.
<code>style</code>	Character vector of length one indicating the style of the corresponding columns. Can be composed with <code>"d"</code> (default), <code>"e"</code> (emphasis), <code>"m"</code> (monospaced), <code>"a"</code> (cells can contain any of the AsciiDoc elements that are allowed inside document), <code>"l"</code> (literal), <code>"v"</code> (verse; all line breaks are retained). Default is <code>""</code> .
<code>...</code>	Additional arguments. (Currently ignored.)

Table 1: ascii

x	An object of class "ascii"
type	Type of syntax produce. Possible values for type are "asciidoc", "t2t" or "textile". Default value produce AsciiDoc syntax.
list.type	Character vector of length one indicating the list type ("bullet", "number" or "none"). Default is "bullet".
...	Additional arguments. (Currently ignored.)

Table 2: print.ascii

```
[25] ascii.summary.glm      ascii.summary.lm
[27] ascii.summary.prcomp   ascii.summary.table
[29] ascii.survdiff         ascii.tab1
[31] ascii.table            ascii.ts
[33] ascii.zoo
```

4.1 vector

```
> ascii(1:4)
| 1.00 | 2.00 | 3.00 | 4.00 |
```

```
| 1.00 | 2.00 | 3.00 | 4.00 |
```

4.2 matrix

```
> ascii(VADeaths, include.rownames = T, include.colnames = T, caption = "VADeaths",
+       header = T, col.width = c(1, 2, 2, 2, 2, 2), valign = "middle",
+       align = "lrrrr", frame = "topbot")
```

```

```

5 convert

Sweave process creates a `yourdocument.txt` file from `yourdocument.Rnw`.

```
Sweave("yourdocument.Rnw", RweaveXxx)
```

You can convert it to html format with the following command:

```
asciidoc yourdocument.txt
or
txt2tags -t html yourdocument.t2t
```

or to xhtml, docbook, man, tex...

For example, you can see the source of [this documentation](#), the file [generated by Sweave](#), the same file in [docbook format](#), the same file [converted to pdf](#) with dlatex, and the same file [converted to odt](#) with docbook2odf.
